Modularity of termination: combination of theories

 $\mathcal T\text{-}\mathsf{decision}$ procedures based on subterm-inactivity

 $\mathcal T\text{-}\mathsf{decision}$ procedures based on variable-inactivity

 $\mathcal{T}\text{-}\mathsf{decision}$ by decomposition

Outline Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Modularity of termination for combination of theories

Modularity of termination:

if $S\mathcal{P}_{\succ}$ -strategy terminates on \mathcal{T}_i -sat problems then it terminates on \mathcal{T} -sat problems for $\mathcal{T} = \bigcup_{i=1}^n \mathcal{T}_i$.

Hypotheses:

- No shared function symbols (shared constants allowed)
- Variable-inactive theories

Outline Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Variable-inactivity

Clause C variable-inactive: no maximal literal in C is equation $t \simeq x$ where $x \notin Var(t)$

Set of clauses variable-inactive: all its clauses are

 \mathcal{T} variable-inactive: the limit $S_{\infty} = \bigcup_{j \ge 0} \bigcap_{i \ge j} S_i$ of a fair derivation from $\mathcal{T} \cup S$ is variable-inactive

 $\begin{array}{l} \mbox{Modularity of termination: combination of theories}\\ \mathcal{T}\mbox{-decision procedures based on subterm-inactivity}\\ \mathcal{T}\mbox{-decision procedures based on variable-inactivity}\\ \mathcal{T}\mbox{-decision by decomposition} \end{array}$

Examples

$$\begin{array}{rcl} C_1 &=& \mathsf{car}(\mathsf{cons}(x,y)) \simeq x \\ C_2 &=& z \simeq w \lor \mathsf{select}(\mathsf{store}(x,z,v),w) \simeq \mathsf{select}(x,w) \\ C_3 &=& \bigvee_{1 \leq j < k \leq n} (x_j \simeq x_k) \end{array}$$

 C_1 variable-inactive C_2 variable-inactive C_3 not variable-inactive (*cardinality constraint clause*)

 $\begin{array}{l} \mbox{Modularity of termination: combination of theories}\\ \mathcal{T}\mbox{-decision procedures based on subterm-inactivity}\\ \mathcal{T}\mbox{-decision procedures based on variable-inactivity}\\ \end{array}$

The modularity theorem

Theorem: if

- T_i , $1 \le i \le n$, do not share function symbols
- \mathcal{T}_i , $1 \leq i \leq n$, variable-inactive
- ▶ SP_{\succ} -strategy is a T_i -satisfiability procedure, $1 \le i \le n$,

then it is a \mathcal{T} -satisfiability procedure for $\mathcal{T} = \bigcup_{i=1}^{n} \mathcal{T}_{i}$.

All theories considered so far are variable-inactive.

 $\begin{array}{l} & \text{Outline} \\ & \text{Modularity of termination: combination of theories} \\ \mathcal{T}\text{-decision procedures based on subterm-inactivity} \\ & \mathcal{T}\text{-decision procedures based on variable-inactivity} \\ & \mathcal{T}\text{-decision by decomposition} \end{array}$

Explanation of the proof of the theorem

- No shared function symbol: no paramodulation from compound terms across theories
- Variable-inactivity: no paramodulation from variables across theories, since for t ≃ x where x ∈ Var(t) it is t ≻ x

Only paramodulations from constants into constants: finitely many.

Outline Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Comment on shared function symbols

- If T₁ contains an axiom where f occurs and T₂ contains another axiom where f occurs, we may have all possible inferences between two general clauses, of whom we know no special properties or restrictions.
- The symbols from the theories appear freely mixed in S, and are separated by flattening (does the job of "purification").

 $\begin{array}{l} \mbox{Modularity of termination: combination of theories}\\ \mathcal{T}\mbox{-decision procedures based on subterm-inactivity}\\ \mathcal{T}\mbox{-decision procedures based on variable-inactivity}\\ \end{array}$

Variable-inactive theories

- ► Purely equational theories: no trivial models ⇒ variable-inactive
- ► Horn theories: no trivial models + maximal unit strategy ⇒ variable-inactive
- Maximal unit strategy: restricts superposition to unit clauses and paramodulates unit clauses into maximal negative literals

Outline Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Variable inactivity and stable-infiniteness

Lemma: If S_0 is a finite satisfiable set of clauses, then S_0 admits no infinite models if and only if the limit S_{∞} of any fair $S\mathcal{P}_{\succ}$ -derivation from S_0 contains a cardinality constraint clause.

Theorem: If \mathcal{T} is variable-inactive, then it is stably-infinite.

Lemma from:

Maria Paola Bonacina, Silvio Ghilardi, Enrica Nicolini, Silvio Ranise and Daniele Zucchelli. Decidability and undecidability results for Nelson-Oppen and rewrite-based decision procedures.

Proc. 3rd IJCAR, LNAI 4130:513-527, Springer 2006.

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

$\mathcal{T}\text{-}\mathsf{decision}$ procedure

 $\mathcal{T}\text{-}decision\ procedure:}$ decide satisfiability of a conjunction of ground clauses in theory \mathcal{T}

- S: set of ground clauses in the signature of \mathcal{T}
- \mathcal{T} : presentation of a theory

 \bowtie is either \simeq or $\not\simeq$

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Flat and strictly flat

Depth:

depth(t) = 0, if t is constant or variable $depth(t) = 1 + max{depth(t_i): 1 \le i \le n}$, if t is $f(t_1, ..., t_n)$ $depth(l \bowtie r) = depth(l) + depth(r)$

Term: *t* is flat if depth(t) ≤ 1 , strictly flat if depth(t) = 0

Literal: $l \simeq r$ is flat if $depth(l \simeq r) \le 1$ $l \not\simeq r$ is flat if $depth(l \not\simeq r) = 0$ $l \bowtie r$ is strictly flat if $depth(l \bowtie r) = 0$

Clause: C is (strictly) flat if all its literals are $Maxd(C) = max\{depth(t): t \text{ occurs in } C\}$

・ロン ・四 と ・ 回 と ・ 回 と

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Flattening

- S: given set of ground clauses
- S': flattened version of S such that
 - all unit clauses in S' are flat
 - ▶ all non-unit clauses in S' are strictly flat
 - ▶ $\mathcal{T} \cup S \equiv_{s} \mathcal{T} \cup S'$, where \equiv_{s} means equisatisfiable

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Example

$$S = \{f(f(a)) \simeq b \lor f(c) \not\simeq d\}$$

$S' = \{f(a) \simeq c_1, f(c_1) \simeq c_2, f(c) \simeq c_3, c_2 \simeq b \lor c_3 \not\simeq d\}$

イロト イヨト イヨト イヨト 三日

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

- Simplification ordering
- Complete: total on ground terms
- *"Good"*: t ≻ c for all ground compound terms t and constants c

Thus, we drop requirements such as $a \succ e \succ i$ for arrays.

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Intuition

In a \mathcal{T} -decision problem we distinguish:

- ► *T_g*: ground clauses
- T₁: non-ground clauses about properties that can be deduced using one interpreted function
- T₂: non-ground clauses about the interaction of two interpreted functions

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Example: Arrays

$$\begin{array}{ll} \forall x, z, v. & \text{select}(\text{store}(x, z, v), z) \simeq v \\ \forall x, z, w, v. & z \not\simeq w \supset \text{select}(\text{store}(x, z, v), w) \simeq \text{select}(x, w) \\ \forall x, y. & \forall z. \, \text{select}(x, z) \simeq \text{select}(y, z) \supset x \simeq y \end{array}$$

First two axioms: in \mathcal{T}_2 Third axiom (*extensionality*): in \mathcal{T}_1

 $\begin{array}{l} \mbox{Modularity of termination: combination of theories}\\ \mathcal{T}\mbox{-decision procedures based on subterm-inactivity}\\ \mathcal{T}\mbox{-decision procedures based on variable-inactivity}\\ \hline{\mathcal{T}\mbox{-decision by decomposition}} \end{array}$

Subterm-inactivity of a 3-tuple

 $\mathcal{T}_g, \mathcal{T}_1, \mathcal{T}_2 :$ disjoint sets of clauses

 $\langle \mathcal{T}_g, \mathcal{T}_1, \mathcal{T}_2
angle$ is subterm-inactive if

- \mathcal{T}_g is ground and flattened
- \$\mathcal{T}_1\$ is interaction-free from \$\mathcal{T}_2\$ and satisfies certain closure properties
- T_2 is saturated and satisfies certain closure properties

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Subterm-inactivity of a set

Set *P* is subterm-inactive if $P = T_g \uplus T_1 \uplus T_2$ such that $\langle T_g, T_1, T_2 \rangle$ is subterm-inactive.

Say P is presentation \mathcal{T} : typically $\mathcal{T}_g = \emptyset$.

If presentation \mathcal{T} is subterm-inactive, then $\mathcal{T} \cup S$, where S is ground and flattened, is also: $\mathcal{T} \cup S = S \uplus \mathcal{T}_1 \uplus \mathcal{T}_2$

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

The subterm-inactivity theorem

If $\mathcal{T}_g \uplus \mathcal{T}_1 \uplus \mathcal{T}_2$ is *subterm-inactive*, then:

For all persistent clauses D generated by SP:

- ► Maxd(D) ≤ max{Maxd(C): C premise} (depth-preserving)
- If D is ground, $\langle T_g \cup \{D\}, T_1, T_2 \rangle$ is subterm-inactive
- ▶ If *D* is not ground, $\langle T_g, T_1 \cup \{D\}, T_2 \rangle$ is *subterm-inactive*
- SP_{\succ} -strategy is T-decision procedure
- T is variable-inactive (hence easy to combine)

 $\begin{array}{c} & \text{Outline} \\ & \text{Modularity of termination: combination of theories} \\ & \mathcal{T}\text{-decision procedures based on subterm-inactivity} \\ & \mathcal{T}\text{-decision procedures based on variable-inactivity} \\ & \mathcal{T}\text{-decision by decomposition} \end{array}$

Impact of subterm-inactivity on binary inferences

- An SP-inference between two clauses in T₁ generates a clause in T₁ or T_g (Closure properties)
- ► An SP-inference between two clauses in T₂ generates a clause that is deleted eventually (Saturation)
- No SP-inference applies to a clause in T₁ and a clause in T₂ (Interaction-freeness)
- An SP-inference between a clause in $T_1 \cup T_2$ and a clause in T_g generates a clause in T_1 or T_g (Closure properties + flatness)

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Impact of subterm-inactivity on unary inferences

- An SP-inference from a clause in T₁ generates a clause that is in T₁ or in T_g or is deleted eventually (Closure properties)
- An SP-inference from a clause in T₂ generates a clause that is deleted eventually (Saturation)

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Subterm-inactive theories

Equality

- Arrays with or without extensionality + two variations
- Recursive data structures (including integer offsets and acyclic lists)
- Finite sets with or without extensionality

Not included: Records, integer offsets modulo, possibly empty possibly cyclic lists

 $\begin{array}{l} \mbox{Modularity of termination: combination of theories}\\ \ensuremath{\mathcal{T}\mbox{-}decision procedures based on subterm-inactivity}\\ \ensuremath{\mathcal{T}\mbox{-}decision procedures based on variable-inactivity}\\ \ensuremath{\mathcal{T}\mbox{-}decision by decomposition} \end{array}$

Variations on the theory of arrays

Add to A an *injectivity predicate* to state than an array is injective:

 $\mathit{Inj}(x) \Leftrightarrow \forall z, w. \ (z \not\simeq w \supset \mathsf{select}(x, z) \not\simeq \mathsf{select}(x, w))$

► Add to
$$\mathcal{A}$$
 a swap predicate:
 $Swap(x, y, z_1, z_2) \Leftrightarrow$
 $select(x, z_1) \simeq select(y, z_2) \land$
 $select(x, z_2) \simeq select(y, z_1) \land$
 $\forall w. (w \neq z_1 \land w \neq z_2 \supset select(x, w) \simeq select(y, w))$

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Finite sets

$$\begin{array}{ll} \forall x, v. & \mathsf{member}(v, \mathsf{insert}(v, x)) \simeq true \\ \forall x, v, w. & v \not\simeq w \supset \mathsf{member}(v, \mathsf{insert}(w, x)) \simeq \mathsf{member}(v, x) \\ \forall x, y. & \forall v. \mathsf{member}(v, x) \simeq \mathsf{member}(v, y) \supset x \simeq y \end{array}$$

First two axioms: \mathcal{FS} With third axiom (*extensionality*): \mathcal{FS}^e

イロト イヨト イヨト イヨト

臣

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

A non-obvious example

If we add to \mathcal{A} the axiom: $Const_y(x) \Leftrightarrow \forall z. \text{ select}(x, z) \simeq y$ the resulting theory is not subterm-inactive.

It is not variable-inactive either:

$$S = \{store(a, i, e_1) \simeq a', Const_e(a), Const_{e'}(a')\} \Leftrightarrow \{store(a, i, e_1) \simeq a', select(a, z) \simeq e, select(a', z) \simeq e'\}$$

Superposition of store(a, i, e_1) $\simeq a'$ into axiom $z \simeq w \lor$ select(store(x, z, v), w) \simeq select(x, w) generates $w \simeq i \lor$ select(a, w) \simeq select(a', w) which is simplified to $w \simeq i \lor e \simeq e'$ which is not variable-inactive because $w \simeq i$ is maximal. $\begin{array}{l} & \text{Outline} \\ & \text{Modularity of termination: combination of theories} \\ & \mathcal{T}\text{-decision procedures based on subterm-inactivity} \\ & \mathcal{T}\text{-decision procedures based on variable-inactivity} \\ & \mathcal{T}\text{-decision by decomposition} \end{array}$

Discussion

- Termination results for T-satisfiability procedures were obtained by analyzing all possible SP-inferences
- Subterm-inactivity is obtained by generalizing those analyses
- Its conditions are syntactic and most of them could be tested automatically
- However, they are very complicated, inter-twined and not intuitive
- Simpler, hence better, approach: T-decision procedures assuming only variable-inactivity

 $\begin{array}{l} \mbox{Modularity of termination: combination of theories}\\ \mathcal{T}\mbox{-decision procedures based on subterm-inactivity}\\ \mathcal{T}\mbox{-decision procedures based on variable-inactivity}\\ \mathcal{T}\mbox{-decision by decomposition} \end{array}$

Flattening again

- S: given set of ground clauses
- $S_1 \uplus S_2$: flattened version of S such that
 - ► S₁: unit flat clauses
 - ► S₂: strictly flat non-unit clauses
 - ▶ $T \cup S \equiv_s T \cup S_1 \cup S_2$, where \equiv_s means equisatisfiable

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Example

$$S = \{f(a) \not\simeq f(b) \lor f(a) \not\simeq f(c)\}$$

$$S_1 = \{f(a) \simeq a', f(b) \simeq b', f(c) \simeq c'\}$$

$$S_2 = \{a' \not\simeq b' \lor a' \not\simeq c'\}$$

where a', b', c' are new constants

$\mathcal{T}\text{-}\mathsf{decision}$ procedures based on variable-inactivity

Theorem: if

- \mathcal{T} is variable inactive
- ▶ SP_{\succ} -strategy is T-satisfiability procedure

then it is also \mathcal{T} -decision procedure.

$\mathcal T\text{-}\mathsf{decision}$ scheme

イロン 不同 とくほと 不良 とう

æ

 $\begin{array}{l} \mbox{Modularity of termination: combination of theories}\\ \mathcal{T}\mbox{-decision procedures based on subterm-inactivity}\\ \mbox{$\mathcal{T}\mbox{-decision procedures based on variable-inactivity}\\ \mbox{$\mathcal{T}\mbox{-decision by decomposition}} \end{array}$

Explanation: analysis of inferences

Lemma:

- C: variable-inactive clause
- C': strictly flat ground clause
 - 1. C' paramodulates into C:

$$C = I[a] \bowtie r \lor D$$

$$C' = a \simeq a'' \lor D'$$

Generated clause: $I[a''] \bowtie r \lor D \lor D'$

2. C paramodulates into C':

$$C = a \simeq a' \lor D$$
 (also strictly flat)

$$C' = a \bowtie a'' \lor D'$$

Generated clause: $a' \bowtie a'' \lor D \lor D'$ (also strictly flat)

In both cases mgu is empty.

 $\begin{array}{l} \mbox{Modularity of termination: combination of theories}\\ \mathcal{T}\mbox{-decision procedures based on subterm-inactivity}\\ \mathcal{T}\mbox{-decision procedures based on variable-inactivity}\\ \mathcal{T}\mbox{-decision by decomposition} \end{array}$

Proof of the \mathcal{T} -decision theorem

- S_{∞} limit of derivation from $\mathcal{T} \cup S_1$ is
 - finite
 - variable-inactive
- S₂ is strictly flat
- ▶ All inferences between S_{∞} and S_2 are paramodulations from constants into constants: finitely many in a finite signature

Rewrite-based decision procedures

Putting it all together

- Variable-inactivity is the fundamental requirement for both
 - Combination of theories
 - Generalization to *T*-decision problems

Maria Paola Bonacina

- The *T*-decision scheme applies also when *T* is a union of variable-inactive theories
- The two applications of SP are only for clarity: if S_∞ limit of derivation from T ∪ S₁ is finite and variable-inactive, it will be such also in a single run from T ∪ S₁ ∪ S₂, and it will have only finitely many inferences with strictly flat S₂.

Modularity of termination: combination of theories T-decision procedures based on subterm-inactivity T-decision procedures based on variable-inactivity T-decision by decomposition

Decomposition: unite FOL+= and SMT strengths

- Decomposition: definitional and operational part
- Theory compilation: apply FOL+= prover to "compile" the definitional part: theory reasoning, non-ground equational reasoning
- Decision: apply SMT-solver to subset of saturated set (without T-axioms) + operational part
- Sufficient conditions to preserve satisfiability

Outline Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Decomposition

Decomposition: generalization of flattening, where S is decomposed into S_1 and S_2 ; it suffices that S_1 be made of *flat unit clauses*.

- ► Records: S₁ contains the clauses rstore_i(a, e) ≃ b and S₂ contains everything else
- Integer offsets: same as flattening
- ► Arrays: S₁ contains the clauses store(a, i, e) ≃ a' and S₂ contains everything else

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Framework of sufficient conditions

 \mathcal{T} -compatibility: A is \mathcal{T} -compatible with S if A entails every clause generated from premise in S and premise in \mathcal{T}

Theorem: \overline{S} is \mathcal{T} -compatible with S where $S_{\infty} = \mathcal{T} \cup \overline{S}$ is the limit generated by $S\mathcal{P}$ from $\mathcal{T} \cup S$

 $\mathcal{T}\mbox{-stability:}$ ensures that $\mathcal{T}\mbox{-compatibility}$ is preserved by all inferences:

if A is \mathcal{T} -compatible with S and $\mathcal{T} \cup S \vdash \mathcal{T} \cup S'$ then A is \mathcal{T} -compatible with S'.

Outline Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

$\mathcal T\text{-}\mathsf{decision}$ by stages: the main theorem

Theorem: under \mathcal{T} -stability, if A and A' are sets of clauses such that

$$\blacktriangleright \mathcal{T} \cup S_1 \models A$$

$$\blacktriangleright \mathcal{T} \cup S_2 \models A'$$

- A is \mathcal{T} -compatible with S_1
- A' is \mathcal{T} -compatible with S_2

then $\mathcal{T} \cup S_1 \cup S_2 \equiv_{\mathrm{s}} A \cup A'$.

Instance of the theorem: A' is S_2 itself; A is \overline{S} where $S_{\infty} = \mathcal{T} \cup \overline{S}$ is the limit generated by $S\mathcal{P}$ from $\mathcal{T} \cup S_1$

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

\mathcal{T} -decision by stages

æ

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Application to the theories

- ▶ **Records**: $\overline{S} \cup S_2$ is ground: its satisfiability can be decided by decision procedure for equality (reduction to EUF)
- Integer offsets: same as for records
- ► Arrays: \$\overline{S} \cup S_2\$ is not ground: \$\overline{S}\$ contains select(\$a, x\$) \$\simes\$ select(\$a', x\$) \$\forall x\$ \$\simes\$ is possibly empty, ground, strictly flat lt falls in the array property fragment.

Modularity of termination: combination of theories \mathcal{T} -decision procedures based on subterm-inactivity \mathcal{T} -decision procedures based on variable-inactivity \mathcal{T} -decision by decomposition

Postponing theories

How about theories such as arithmetic or bitvectors that do not lend themselves to general first-order deduction?

Those parts of the problem can be left into S_2 and passed on directly to the SMT-solver.
