Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma + T$ ) III part: Discussion of current trends in the field

#### Introduction: Towards model-based reasoning

I part: A classic from the literature: DPLL-CDCL

II part: Solver + prover in DPLL( $\Gamma$ +T)

III part: Discussion of current trends in the field

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma+T$ ) III part: Discussion of current trends in the field

#### Automated reasoning

- In AI we work with symbols: automated reasoning is symbolic reasoning
- Symbolic reasoning: Logico-deductive, Probabilistic ...

・ロト ・日 ・ ・ ヨ ・ ・ 日 ・

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma + T$ ) III part: Discussion of current trends in the field

#### The gist of this lecture I

- Automated reasoning from proofs to models
- Models are relevant to applications, e.g.:
  - Program verification: a program state is a model
  - Program testing: model as "mole" in automated test generation
  - Program synthesis: model as example in example-driven synthesis

Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma+T$ ) III part: Discussion of current trends in the field

### The gist of this lecture II

- Proofs mean proving
- Models mean solving
- Towards integrations of proving and solving

イロト イボト イヨト

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma + T$ ) III part: Discussion of current trends in the field

### Symbolic reasoning: Proving

- Validity:  $\mathcal{T} \models \varphi$
- Refutationally:  $\mathcal{T} \cup \{\neg \varphi\}$  unsatisfiable
- ▶ Inference:  $\mathcal{T} \cup \{\neg \varphi\} \vdash \bot$  (Success!)
- If not:  $\mathcal{T}$ -model of  $\neg \varphi$ , counter-example for  $\varphi$

イロト イボト イラト イラト

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma + T$ ) III part: Discussion of current trends in the field

### Symbolic reasoning: Solving

- Satisfiability: is there a *T*-model of φ?
- Search: solution found (Success!)
- If not:  $T \cup \{\varphi\}$  unsatisfiable,  $T \models \neg \varphi$

イロト イボト イラト イラト

 $\begin{array}{c} \text{Outline} \\ \textbf{Introduction: Towards model-based reasoning} \\ \textbf{I part: A classic from the literature: DPLL-CDCL} \\ \textbf{II part: Solver + prover in DPLL}(\Gamma+\mathcal{T}) \\ \textbf{III part: Discussion of current trends in the field} \end{array}$ 

### Theorem proving strategies (Semi-decision procedures)

- First-order logic with equality
- Unsatisfiability is semi-decidable, satisfiability is not
- Search for proof (refutation)
- Models for semantic guidance,e.g.:
  - Hyper-resolution
  - Set of support
  - Semantic resolution

 $\label{eq:line} \begin{array}{l} \text{Outline} \\ \text{Introduction: Towards model-based reasoning} \\ \text{I part: A classic from the literature: DPLL-CDCL} \\ \text{II part: Solver + prover in DPLL}(\Gamma+\mathcal{T}) \\ \text{III part: Discussion of current trends in the field} \end{array}$ 

### Algorithmic reasoning (Decision procedures)

- Satisfiability decidable: Symmetry restored
- Propositional logic
- Decidable (fragments of) first-order theories, e.g.:
  - QFF: equality, recursive data structures (e.g., lists), arrays
  - Linear arithmetic (integers, rationals), arithmetic (algebraic reals)

Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma+T$ ) III part: Discussion of current trends in the field

#### Towards integration I

Integrating solvers (e.g., arithmetic) into first-order reasoners

Maria Paola Bonacina Topics in Model-Based Reasoning

Image: A match the second s

Outline **Introduction: Towards model-based reasoning** I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma + T$ ) III part: Discussion of current trends in the field

#### Towards integration II

Integration in the reasoner's operations:

- Deduction guides search for model
- Candidate partial model guides deduction
- How?

イロト イボト イヨト

 $\label{eq:constraint} \begin{array}{l} Outline \\ Introduction: Towards model-based reasoning \\ \textbf{I part: A classic from the literature: DPLL-CDCL \\ II part: Solver + prover in DPLL(\Gamma+\mathcal{T}) \\ III part: Discussion of current trends in the field \end{array}$ 

### I part: A classic from the literature: DPLL-CDCL

- DPLL: The Davis-Putnam-Logemann-Loveland procedure with
- Conflict driven clause learning (DPLL-CDCL), or
- How the integration of search and inference in propositional logic brought Boolean satisfiability from theoretical hardness to practical success

Image: A match the second s

### Propositional logic (SAT)

- Davis-Putnam-Logemann-Loveland (DPLL) procedure
- Decision procedure: model found: return sat; failure: return unsat
- Backtracking search for model

Image: A match the second s

- Build candidate model M
- State of derivation:  $M \parallel F$ 
  - *M*: sequence of truth assignments
  - F: clauses to satisfy
- Depth-first search with backtracking

イロト イボト イヨト

# DPLL-CDCL I

State of derivation:  $M \parallel F$ 

- Decide: guess L is true, add it to M (decided literal)
- UnitPropagate: propagate consequences of assignment (implied literals)
- Conflict: detect  $L_1 \vee \ldots \vee L_n$  all false
- ▶ Unsat: conflict clause is □ (nothing else to try)
- Sat: all variables assigned

 $\label{eq:line} \begin{array}{l} \text{Outline} \\ \text{Introduction: Towards model-based reasoning} \\ \textbf{I part: A classic from the literature: DPLL-CDCL} \\ \text{II part: Solver + prover in DPLL}(\Gamma+\mathcal{T}) \\ \text{III part: Discussion of current trends in the field} \end{array}$ 

# DPLL-CDCL II

#### State of derivation: $M \parallel F$

- Explain: unfold implied literals in conflict clause by resolution
- Learn conflict clause  $C \vee L$
- ► Backjump: when only *L* assigned at current decision level, jump back to least recent level where *C* false and *L* unassigned, undo at least one decision, make *L* true (implied by *C* ∨ *L*)

 $\label{eq:constraint} \begin{array}{l} Outline \\ Introduction: Towards model-based reasoning \\ \textbf{I part: A classic from the literature: DPLL-CDCL \\ II part: Solver + prover in DPLL(\Gamma+\mathcal{T}) \\ III part: Discussion of current trends in the field \end{array}$ 

### Conflict-Driven Clause Learning (CDCL)

- ▶ Conflict: *M* falsifies clause  $L_1 \lor \ldots \lor L_n$ : conflict clause
- Explain: resolve and get another conflict clause
  L<sub>1</sub> ∨ ... ∨ L<sub>n</sub>
  ¬L<sub>1</sub> ∨ Q<sub>2</sub> ... ∨ Q<sub>k</sub>
- Learn: may add resolvent(s)
- Backjump: undoes at least an assignment, jumps back as far as possible to state where learnt resolvent can be satisfied

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma+T$ ) III part: Discussion of current trends in the field

### Example of CDCL

 $F = \{\neg a \lor b, \neg c \lor d, \neg e \lor \neg f, f \lor \neg e \lor \neg b\}$   $M = a \ b \ c \ d \ e \ \neg f$ blue: assignments; violet: propagations

Conflict:  $f \lor \neg e \lor \neg b$ Explain by resolving  $f \lor \neg e \lor \neg b$  and  $\neg e \lor \neg f$ :  $\neg e \lor \neg b$ Learn  $\neg e \lor \neg b$ : no model with e and b true Jump back to earliest state with  $\neg b$  false and  $\neg e$  unassigned:  $M = a \ b \neg e$ 

Chronological backtracking:  $M = a b c d \neg e$ 

・ロト ・回 ト ・ヨト ・ヨト

 $\label{eq:constraint} \begin{array}{l} \text{Outline} \\ \text{Introduction: Towards model-based reasoning} \\ \textbf{I part: A classic from the literature: DPLL-CDCL} \\ \text{II part: Solver + prover in DPLL}(\Gamma+\mathcal{T}) \\ \text{III part: Discussion of current trends in the field} \end{array}$ 

### Decision procedures

- Davis-Putnam-Logemann-Loveland (DPLL) procedure for SAT
- *T*-solver: Decision procedure for *T* Equality: congruence closure (CC)
- ▶ DPLL(*T*)-based SMT-solver: Decision procedure for *T* = ∪<sup>n</sup><sub>i=1</sub> *T*<sub>i</sub> with
- Combination of T<sub>i</sub>-sat procedures by a method called equality sharing

 $\label{eq:constraint} \begin{array}{l} Outline \\ Introduction: Towards model-based reasoning \\ I part: A classic from the literature: DPLL-CDCL \\ II part: Solver + prover in DPLL(\Gamma+\mathcal{T}) \\ III part: Discussion of current trends in the field \end{array}$ 

### Satisfiability modulo theories (SMT)

- ▶ DPLL( $\mathcal{T}$ ) procedure
- Integrate  $\mathcal{T}$ -satisfiability procedure in DPLL
- Ground first-order literals abstracted to propositional variables
- CDCL: same

State of derivation:  $M \parallel F$ 

- $\mathcal{T}$ -Propagate: add to M an L that is  $\mathcal{T}$ -consequence of M
- ▶  $\mathcal{T}$ -Conflict: detect that  $L_1, \ldots, L_n$  in M are  $\mathcal{T}$ -inconsistent

・ロト ・日ト ・ヨト ・ヨト

 $\label{eq:constraint} \begin{array}{l} Outline \\ Introduction: Towards model-based reasoning \\ I part: A classic from the literature: DPLL-CDCL \\ II part: Solver + prover in DPLL(\Gamma+\mathcal{T}) \\ III part: Discussion of current trends in the field \end{array}$ 

### Theory combination by equality sharing I

- Theories  $\mathcal{T}_1, \ldots, \mathcal{T}_n$
- $\blacktriangleright \ \mathcal{T} = \bigcup_{i=1}^n \mathcal{T}_i$
- ► *T<sub>i</sub>*-satisfiability procedures
- Disjoint: share only  $\simeq$  and uninterpreted constants
- Mixed terms separated by introducing new constants
- Need to agree on:
  - Shared constants
  - Cardinalities of shared sorts

 $\label{eq:constraint} \begin{array}{l} Outline \\ Introduction: Towards model-based reasoning \\ \textbf{I part: A classic from the literature: DPLL-CDCL \\ II part: Solver + prover in DPLL(\Gamma+\mathcal{T}) \\ III part: Discussion of current trends in the field \end{array}$ 

### Theory combination by equality sharing II

- Compute arrangement: which shared constants are equal and which are not
- *T<sub>i</sub>*-solvers generate and propagate all entailed (disjunctions of) equalities between shared constants
- For cardinalities: assume stably infinite: every T<sub>i</sub>-sat ground formula has T<sub>i</sub>-model with infinite cardinality

 $\label{eq:constraint} \begin{array}{l} Outline \\ Introduction: Towards model-based reasoning \\ \textbf{I part: A classic from the literature: DPLL-CDCL \\ II part: Solver + prover in DPLL(\Gamma+\mathcal{T}) \\ III part: Discussion of current trends in the field \end{array}$ 

### Model-based theory combination (MBTC)

- Assume T<sub>i</sub>-satisfiability procedure that builds a T<sub>i</sub>-model (e.g., linear arithmetic)
- ▶ Optimistic approach: propagate equalities true in *T<sub>i</sub>*-model
- If not entailed: conflict + backjumping with CDCL + update *T<sub>i</sub>*-model
- Rationale: few equalities matter in practice

Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma+T$ ) III part: Discussion of current trends in the field

### II part: Solver + prover in DPLL( $\Gamma$ +T)

- **Γ**: first-order inference system
- ▶ DPLL(*T*): SMT-solver with DPLL-CDCL and equality sharing
- A tight integration: the DPLL( $\Gamma + T$ ) method

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL(F+7) III part: Discussion of current trends in the field

#### Motivation

- Decision procedures are most desirable, but ...
- Formulæ from SW verification tools (verifying compiler, static analyzer, test generator, synthesizer, model checker) use quantifiers to write
  - invariants
  - axioms of theories without decision procedure
- Need for generic first-order inferences

Image: A match the second s

Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma+T$ ) III part: Discussion of current trends in the field

### Shape of problem

#### Background theory T

•  $\mathcal{T} = \bigcup_{i=1}^{n} \mathcal{T}_{i}$  (linear arithmetic, data structures)

- Set of formulæ:  $\mathcal{R} \cup P$ 
  - R: set of non-ground clauses without T-symbols
  - P: large ground formula (set of ground clauses) typically with *T*-symbols
- Determine whether  $\mathcal{R} \cup P$  is satisfiable modulo  $\mathcal{T}$

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL([+7) III part: Discussion of current trends in the field

#### Superposition-based inference system $\Gamma$

- FOL+= clauses with universally quantified variables
- Axiomatized theories
- Deduce clauses from clauses (expansion)
- Remove redundant clauses (contraction)
- ► Well-founded ordering >> on terms and literals to restrict expansion and define contraction
- Semi-decision procedure
- No backtracking

イロト イボト イヨト

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma + T$ ) III part: Discussion of current trends in the field

#### Inference system $\Gamma$

State of derivation: set of clauses F

- Resolution
- Superposition/Paramodulation: resolution with equality built-in
- Simplification: by well-founded rewriting
- Subsumption: eliminate less general clauses
- Other rules: e.g., Factoring rules, Deletion of trivial clauses

イロト イボト イヨト イヨ

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL(Γ+7) III part: Discussion of current trends in the field

#### Theorem-proving strategy as decision procedure

- Termination results by analysis of inferences: Γ is
   *T*-satisfiability procedure
- Covered theories include: lists, arrays and records with or without extensionality, recursive data structures

イロト イヨト イヨト

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma + T$ ) III part: Discussion of current trends in the field

#### Also for combination of theories

- If Γ terminates on R<sub>i</sub>-sat problems, it terminates also on R-sat problems for R = U<sup>n</sup><sub>i=1</sub> R<sub>i</sub>, if the R<sub>i</sub>'s are disjoint and variable-inactive
- Variable-inactivity: no maximal literals of the form t ≃ x where x ∉ Var(t) (no paramodulation from variables)
- The only inferences across theories are paramodulations from shared constants (correspond to equalities between shared constants in equality sharing)

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL([+7) III part: Discussion of current trends in the field

#### Variable inactivity implies stable infiniteness

- If  $\mathcal{R}$  is variable-inactive, then it is stably infinite
- ► Γ reveals lack of stable infiniteness by generating a cardinality constraint (e.g., y ≃ x ∨ y ≃ z) which is not variable-inactive

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma + T$ ) III part: Discussion of current trends in the field

#### Recap on first-order inference systems

- Resolution/superposition-based engines good for reasoning on formulæ with quantified variables: automated instantiation
- Not for large non-Horn clauses
- Not for theories such as linear arithmetic or bit-vectors
- Unexpected: they are satisfiability-procedures for theories such as lists, arrays, records and their combinations

 $\label{eq:constraint} \begin{array}{l} \mbox{Introduction: Towards model-based reasoning} \\ \mbox{I part: A classic from the literature: DPLL-CDCL} \\ \mbox{II part: Solver + prover in DPLL(} (F+\mathcal{T}) \\ \mbox{III part: Discussion of current trends in the field} \end{array}$ 

### DPLL( $\Gamma$ +T): integrate $\Gamma$ in DPLL(T) I

#### Model-based deduction:

literals in M can be premises of  $\Gamma$ -inferences

- Stored as hypotheses in inferred clause
- ► Hypothetical clause:  $(L_1 \land ... \land L_n) \triangleright (L'_1 \lor ... L'_m)$ interpreted as  $\neg L_1 \lor ... \lor \neg L_n \lor L'_1 \lor ... \lor L'_m$

 $\label{eq:constraint} \begin{array}{l} \mbox{Introduction: Towards model-based reasoning} \\ \mbox{I part: A classic from the literature: DPLL-CDCL \\ \mbox{II part: Solver + prover in DPLL(} (+\mathcal{T}) \\ \mbox{III part: Discussion of current trends in the field} \end{array}$ 

# DPLL( $\Gamma$ +T): integrate $\Gamma$ in DPLL(T) II

- Inferred clauses inherit hypotheses from premises
- Backjump: remove hypothetical clauses depending on undone assignments

イロト イボト イラト イラト

 $\begin{array}{l} \mbox{Introduction: Towards model-based reasoning} \\ \mbox{I part: A classic from the literature: DPLL-CDCL} \\ \mbox{II part: Solver + prover in DPLL(} (+7) \\ \mbox{III part: Discussion of current trends in the field} \end{array}$ 

### DPLL( $\Gamma$ +T): expansion inferences

- ▶ If non-ground clauses  $C_1, ..., C_m$  and ground  $\mathcal{R}$ -literals  $L_{m+1}, ..., L_n$  generate C:  $H_1 \triangleright C_1, ..., H_m \triangleright C_m$  and  $L_{m+1}, ..., L_n$  in M generate  $H_1 \cup ... \cup H_m \cup \{L_{m+1}, ..., L_n\} \triangleright C$
- Only  $\mathcal{R}$ -literals:  $\Gamma$ -inferences ignore  $\mathcal{T}$ -literals
- ► Take ground unit *R*-clauses from *M* as MBTC puts them there

イロト イボト イヨト

Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma$ +T) III part: Discussion of current trends in the field

### DPLL( $\Gamma$ +T): contraction inferences

- Don't delete clause if clauses that make it redundant gone by backjumping
  - Level of a literal in M: its decision level
  - Level of a set of literals: the maximum

 $\begin{array}{l} \mbox{Introduction: Towards model-based reasoning} \\ \mbox{I part: A classic from the literature: DPLL-CDCL} \\ \mbox{II part: Solver + prover in DPLL(} (+7) \\ \mbox{III part: Discussion of current trends in the field} \end{array}$ 

### DPLL( $\Gamma$ +T): contraction inferences

- ▶ If non-ground clauses  $C_1, ..., C_m$  and ground  $\mathcal{R}$ -literals  $L_{m+1}, ..., L_n$  simplify C to C':  $H_1 \triangleright C_1, ..., H_m \triangleright C_m$  and  $L_{m+1}, ..., L_n$  in M simplify  $H \triangleright C$ to  $H \cup H_1 \cup ... \cup H_m \cup \{L_{m+1}, ..., L_n\} \triangleright C'$ 
  - If level(H) ≥ level(H'): delete
     If level(H) < level(H'): disable (re-enable when backjumping level(H'))

Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma+T$ ) III part: Discussion of current trends in the field

### Completeness of $\mathsf{DPLL}(\Gamma \!\!+\!\! \mathcal{T})$

Refutational completeness of the inference system:
 From that of Γ, DPLL(T) and equality sharing
 Combines both built-in and axiomatized theories

#### Fairness of the search plan:

- Depth-first search fair only for ground SMT problems;
- Add iterative deepening on inference depth:
   *k*-bounded DPLL(Γ+*T*)

イロト イボト イヨト イヨ

Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma+T$ ) III part: Discussion of current trends in the field

# DPLL( $\Gamma$ +T): Summary

Use each engine for what is best at:

- DPLL( $\mathcal{T}$ ) works on ground clauses and built-in theory
- Γ works on non-ground clauses and ground unit clauses taken from M: Γ works on *R*-satisfiability problem
- Γ-inferences guided by current partial model

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma$ +T) III part: Discussion of current trends in the field

### Can DPLL( $\Gamma$ +T) still be a decision procedure?

Problematic axioms do occur in relevant inputs:

1. 
$$\neg(x \sqsubseteq y) \lor f(x) \sqsubseteq f(y)$$
 (Monotonicity)

2. 
$$a \sqsubseteq b$$
 generates by resolution

3. 
$${f^i(a) \sqsubseteq f^i(b)}_{i \ge 0}$$

When  $f(a) \sqsubseteq f(b)$  or  $f^2(a) \sqsubseteq f^2(b)$  often suffice to show satisfiability

Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma+T$ ) III part: Discussion of current trends in the field

### Idea: Allow speculative inferences

- 1.  $\neg(x \sqsubseteq y) \lor f(x) \sqsubseteq f(y)$
- 2. a ⊑ b
- 3.  $a \sqsubseteq f(c)$
- 4.  $\neg(a \sqsubseteq c)$
- 1. Add  $f(x) \simeq x$
- 2. Rewrite  $a \sqsubseteq f(c)$  into  $a \sqsubseteq c$  and get  $\Box$ : backtrack!
- 3. Add  $f(f(x)) \simeq x$
- 4.  $a \sqsubseteq b$  yields only  $f(a) \sqsubseteq f(b)$
- 5.  $a \sqsubseteq f(c)$  yields only  $f(a) \sqsubseteq c$
- 6. Terminate and detect satisfiability

 $\label{eq:constraint} \begin{array}{l} \mbox{Introduction: Towards model-based reasoning} \\ \mbox{I part: A classic from the literature: DPLL-CDCL \\ \mbox{II part: Solver + prover in DPLL(} (+\mathcal{T}) \\ \mbox{III part: Discussion of current trends in the field} \end{array}$ 

# Speculative inferences in DPLL( $\Gamma+T$ )

- Speculative inference: add arbitrary clause C
- To induce termination on satisfiable input
- What if it makes problem unsatisfiable?!
- Detect conflict and backjump:
  - $\triangleright$  [*C*]: new propositional variable (a "name" for *C*)
  - Add  $\lceil C \rceil \triangleright C$  to clauses and  $\lceil C \rceil$  to M
  - Speculative inferences are reversible

Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma+T$ ) III part: Discussion of current trends in the field

#### Example as done by system

- 1.  $\neg(x \sqsubseteq y) \lor f(x) \sqsubseteq f(y)$
- 2. a ⊑ b
- 3.  $a \sqsubseteq f(c)$
- 4.  $\neg(a \sqsubseteq c)$
- 1. Add  $\lceil f(x) \simeq x \rceil \triangleright f(x) \simeq x$
- 2. Rewrite  $a \sqsubseteq f(c)$  into  $\lceil f(x) \simeq x \rceil \triangleright a \sqsubseteq c$
- 3. Generate  $\lceil f(x) \simeq x \rceil \triangleright \Box$ ; Backtrack, learn  $\neg \lceil f(x) \simeq x \rceil$
- 4. Add  $\lceil f(f(x)) \simeq x \rceil \triangleright f(f(x)) \simeq x$
- 5.  $a \sqsubseteq b$  yields only  $f(a) \sqsubseteq f(b)$
- 6.  $a \sqsubseteq f(c)$  yields only  $\lceil f(f(x)) = x \rceil \triangleright f(a) \sqsubseteq c$
- 7. Terminate and detect satisfiability

• □ ▶ • □ ▶ • □ ▶ • □ ▶

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma$ +T) III part: Discussion of current trends in the field

#### Decision procedures with speculative inferences

To decide satisfiability modulo  $\mathcal{T}$  of  $\mathcal{R} \cup P$ :

- Find sequence of speculative axioms U
- Show that there exists k s.t. k-bounded DPLL(Γ+T) is guaranteed to terminate
  - returning Unsat if  $\mathcal{R} \cup P$  is  $\mathcal{T}$ -unsatisfiable
  - in a state which is not stuck at k otherwise

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL(F+7) III part: Discussion of current trends in the field

#### Decision procedures

- R has single monadic function symbol f
- ► Essentially finite: if R ∪ P is satisfiable, has model where range of f is finite
- Such a model satisfies  $f^j(x) \simeq f^k(x)$  for some  $j \neq k$
- Add pseudo-axioms  $f^j(x) \simeq f^k(x), j > k$
- Use  $f^{j}(x) \simeq f^{k}(x)$  as rewrite rule to limit term depth
- **Clause length limited** by properties of  $\Gamma$  and  $\mathcal{R}$
- Only finitely many clauses generated: termination

イロト イボト イラト イラト

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma$ + $\tau$ ) III part: Discussion of current trends in the field

#### Situations where clause length is limited

**Γ**: Superposition, Resolution + negative selection, Simplification Negative selection: only positive literals in positive clauses resolve or superpose

- $\blacktriangleright$   $\mathcal{R}$  is Horn: number of literals in each clause is bounded
- R is ground-preserving: all variables appear also in negative literals the only positive clauses are ground only finitely many clauses generated

Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma$ +T) III part: Discussion of current trends in the field

#### Axiomatizations of type systems

Reflexivity $x \sqsubseteq x$ (1)Transitivity $\neg(x \sqsubseteq y) \lor \neg(y \sqsubseteq z) \lor x \sqsubseteq z$ (2)Anti-Symmetry $\neg(x \sqsubseteq y) \lor \neg(y \sqsubseteq x) \lor x \simeq y$ (3)Monotonicity $\neg(x \sqsubseteq y) \lor f(x) \sqsubseteq f(y)$ (4)Tree-Property $\neg(z \sqsubseteq x) \lor \neg(z \sqsubseteq y) \lor x \sqsubseteq y \lor y \sqsubseteq x$ (5)

Multiple inheritance:  $MI = \{(1), (2), (3), (4)\}$ Single inheritance:  $SI = MI \cup \{(5)\}$ 

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma$ +T) III part: Discussion of current trends in the field

#### Concrete examples of decision procedures

DPLL( $\Gamma$ + $\mathcal{T}$ ) with addition of  $f^j(x) \simeq f^k(x)$  for j > k decides the satisfiability modulo  $\mathcal{T}$  of problems

- ► MI ∪ P
- ► SI ∪ P
- $\blacktriangleright \mathsf{MI} \cup \mathsf{TR} \cup P \text{ and } \mathsf{SI} \cup \mathsf{TR} \cup P$

where  $TR = \{\neg(g(x) \simeq null), h(g(x)) \simeq x\}$  has only infinite models!

(because g is injective, since it has left inverse, but not surjective, since there is no pre-image for null)

イロト イボト イヨト

 $\begin{array}{c} \mbox{Outline} \\ \mbox{Introduction: Towards model-based reasoning} \\ \mbox{I part: A classic from the literature: DPLL-CDCL} \\ \mbox{I I part: Solver + prover in DPLL}(\Gamma+\mathcal{T}) \\ \mbox{III part: Discussion of current trends in the field} \end{array}$ 

#### III part: Discussion of current trends in the field

- Integration of search and inference in first-order theories
- CDCL beyond propositional logic?
- MBTC beyond linear integer arithmetic?

Image: A match the second s

 $\begin{array}{c} \text{Outline} \\ \text{Introduction: Towards model-based reasoning} \\ \text{I part: A classic from the literature: DPLL-CDCL} \\ \text{II part: Solver + prover in DPLL}(\Gamma+\mathcal{T}) \\ \text{III part: Discussion of current trends in the field} \end{array}$ 

### Model-constructing satisfiability procedures (MCsat)

- Satisfiability modulo assignment (SMA)
- *M*: both *L* (means  $L \leftarrow true$ ) and  $x \leftarrow 3$
- CDCL + MBTC
- Theory CDCL: explain theory conflicts and theory propagations
- Beyond input literals: finite bag for termination
- Equality, lists, arrays, linear arithmetic (rationals)

 $\begin{array}{l} \mbox{Introduction: Towards model-based reasoning} \\ \mbox{I part: A classic from the literature: DPLL-CDCL} \\ \mbox{II part: Solver + prover in DPLL($F+$$$$$$$$7$ ) \\ \mbox{III part: Discussion of current trends in the field} \end{array}$ 

### Example of theory explanation (equality)

$$F = \{\ldots, v \simeq f(a), w \simeq f(b), \ldots\}$$

$$M = \dots \ \mathbf{a} \leftarrow \alpha \quad \mathbf{b} \leftarrow \alpha \quad \mathbf{w} \leftarrow \beta_1 \quad \mathbf{v} \leftarrow \beta_2 \ \dots$$

Conflict!

Explain by  $a \simeq b \supset f(a) \simeq f(b)$ (instance of substitutivity)

 $\begin{array}{c} \text{Outline} \\ \text{Introduction: Towards model-based reasoning} \\ \text{I part: A classic from the literature: DPLL-CDCL} \\ \text{II part: Solver + prover in DPLL}(\Gamma+\mathcal{T}) \\ \text{III part: Discussion of current trends in the field} \end{array}$ 

### Example of theory explanation (arithmetic) I

$$F = \{x \ge 2, \ \neg(x \ge 1) \lor y \ge 1, \ x^2 + y^2 \le 1 \lor xy > 1\}$$

• Propagation: 
$$M = x \ge 2$$

- Theory Propagation:  $M = x \ge 2, x \ge 1$
- ▶ Boolean Propagation:  $M = x \ge 2, x \ge 1, y \ge 1$
- ▶ Boolean Decision:  $M = x \ge 2, x \ge 1, y \ge 1, x^2 + y^2 \le 1$
- Semantic Decision:  $M = x \ge 2, x \ge 1, y \ge 1, x^2 + y^2 \le 1, x \leftarrow 2$
- Conflict!: no value for y such that  $4 + y^2 \le 1$

 $\begin{array}{c} \text{Outline} \\ \text{Introduction: Towards model-based reasoning} \\ \text{I part: A classic from the literature: DPLL-CDCL} \\ \text{II part: Solver + prover in DPLL}(\Gamma+\mathcal{T}) \\ \text{III part: Discussion of current trends in the field} \end{array}$ 

### Example of theory explanation (arithmetic) II

$$F = \{x \ge 2, \ \neg(x \ge 1) \lor y \ge 1, \ x^2 + y^2 \le 1 \lor xy > 1\}$$

Assume we'd learn 
$$\neg (x = 2)$$
:  
 $M = x \ge 2, x \ge 1, y \ge 1, x^2 + y^2 \le 1, \neg (x = 2)$ 

- Semantic Decision:  $M = x \ge 2, x \ge 1, y \ge 1, x^2 + y^2 \le 1, \neg(x = 2), x \leftarrow 3$
- Another conflict!
- We don't want to learn  $\neg(x=2), \ \neg(x=3), \ \neg(x=4) \dots$ !

 $\label{eq:constraint} \begin{array}{l} \text{Outline} \\ \text{Introduction: Towards model-based reasoning} \\ \text{I part: A classic from the literature: DPLL-CDCL} \\ \text{II part: Solver + prover in DPLL}(\Gamma + \mathcal{T}) \\ \text{III part: Discussion of current trends in the field} \end{array}$ 

### Example of theory explanation (arithmetic) III

$$F = \{x \ge 2, \ \neg(x \ge 1) \lor y \ge 1, \ x^2 + y^2 \le 1 \lor xy > 1\}$$

- Solution: theory explanation by interpolation
- ▶  $x^2 + y^2 \le 1$  implies  $-1 \le x \land x \le 1$  which is inconsistent with x = 2
- Learn  $\neg (x^2 + y^2 \le 1) \lor x \le 1$
- $M = x \ge 2, \ x \ge 1, \ y \ge 1, \ x^2 + y^2 \le 1, \ x \le 1$

 $\begin{array}{c} \text{Outline} \\ \text{Introduction: Towards model-based reasoning} \\ \text{I part: A classic from the literature: DPLL-CDCL} \\ \text{II part: Solver + prover in DPLL}(\Gamma+\mathcal{T}) \\ \text{III part: Discussion of current trends in the field} \end{array}$ 

### Example of theory explanation (arithmetic) IV

$$F = \{x \ge 2, \ \neg(x \ge 1) \lor y \ge 1, \ x^2 + y^2 \le 1 \lor xy > 1\}$$

- $M = x \ge 2, \ x \ge 1, \ y \ge 1, \ x^2 + y^2 \le 1, \ x \le 1$
- Theory conflict:  $x \ge 2$  and  $x \le 1$
- Learn lemma:  $\neg(x \ge 2) \lor \neg(x \le 1)$
- ▶ Boolean Explanation (by resolution):  $\neg(x^2 + y^2 \le 1) \lor x \le 1$ and  $\neg(x \ge 2) \lor \neg(x \le 1)$  yield  $\neg(x^2 + y^2 \le 1) \lor \neg(x \ge 2)$

▶ Boolean Explanation (by resolution):  $\neg(x^2 + y^2 \le 1) \lor \neg(x \ge 2)$  and  $x \ge 2$  yield  $\neg(x^2 + y^2 \le 1)$ ▶  $M = x \ge 2$ ,  $x \ge 1$ ,  $x \ge 1$ ,  $-(x^2 + y^2 \le 1)$ 

•  $M = x \ge 2, \ x \ge 1, \ y \ge 1, \ \neg (x^2 + y^2 \le 1)$ 

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma+T$ ) III part: Discussion of current trends in the field

#### Recent trends in model-based reasoning

- Deduction guides search for model
- Candidate model guides deduction
- Propositional CDCL (both DPLL and DPLL(T))
- Model-based theory combination (MBTC)
- ► DPLL( $\Gamma$ +T)
- CDCL for arithmetic (aka Natural domain SMT)
- Model-constructing satisfiability procedures (MCsat)

Outline Introduction: Towards model-based reasoning I part: A classic from the literature: DPLL-CDCL II part: Solver + prover in DPLL( $\Gamma+T$ ) III part: Discussion of current trends in the field

### Ideas for future work

- MCsat procedures for more first-order theories e.g., Boolean algebra with Presburger arithmetic (BAPA)
- More decision procedures by speculative inferences
- MCsat + Γ
